

Abstract of the Disclosure

A decorative molding/casing for use in decorating a room or furniture as disclosed.

The decorative molding/casing in general has a routed or lazared front surface establishing a front face section. The rear surface of the molding/casing is preferably milled to create a

5 longitudinal groove which establishes a first interior surface and a pair of symmetric support sections. Any desired artistic design cutouts may then be routed or lazared through the front face section and through the first interior surface into the longitudinal groove. A filler

material is then colored or selected. The filler material may then be positioned within the longitudinal groove between the pair of symmetric support sections. The colored surface of

10 the filler material may then be positioned proximate to the first interior surface where the filler material may be secured to the first interior surface by any preferred means as desired by an individual. The colored surface of the filler material then functions as an accent for the decorative molding/casing which may be used as a border or other decorative accent feature within a room or upon furniture or picture frames.
